

Have read much about this proposal in Amateur radio magazines, however, I see nothing to protect the LICENSED amateur radio services from harmful interference. Already in the test sites at lower than their requested power, there is already SIGNIFICANT interference to amateur as well as other LICENSED services. I thought licensed services were protected from this harmful interference, and given the track record of power companies shirking their responsibilities over noise due to dirty insulators and switches, I don't see why they would take a "cash cow" like BPL offline due to complaints. Interference has already been proven, so they should clean up their act, or take it off the air, as they are interfering with LICENSED services!
